

## Imagine Your Baby Suffering From A Bacterial Infection.

## Now Imagine That You Could Have Helped Prevent It With *Prevnar* Vaccine.

It's even more painful for you to watch your baby suffering from bacterial infections, knowing that you could have prevented them. Diseases such as meningitis, ear infections, pneumonia and blood infections are caused by pneumococcus bacterium, which can be spread by coughing and sneezing. *Prevnar* Vaccine can help protect your baby from all of these. And for your convenience, *Prevnar* Vaccine is given at the regular baby check-ups along with other vaccines against childhood infections.

*Prevnar* Pneumococcal Conjugate Vaccine is recommended for the active vaccination of infants and children from 6 weeks until 9 years of age against meningitis, blood infections, pneumonia and ear infections caused by the seven bacterial strains of pneumococcus included in the vaccine.

**Ask your doctor how *Prevnar* Vaccine can  
help protect your child, starting today.**
